Game refinement candidate

Code: 021e23a85c0212f6e780a5d5af4ebe70c4fadf76 | branch codex/game-v5-refinement | draft PR #2

Stock now shows per-product order totals, affordability, stock and placement status, with 1/5/10/20 quantity shortcuts and an in-place shelf choice. Keyboard focus survives a busy purchase and returns to the same card after shelf placement.

Five existing locales were audited using zh-HK as the meaning baseline. Written wording now connects selection, buying, display, opening, sales and profit without changing story predicates or implying that a rendered visitor owns an economic transaction.

Art refines the actual playable geometry: continuous swept bob, rounded sleeves/cuffs, fitted cream blouse, waist apron and longer plum silhouette. Warm window light, cooler exterior fill, softer wood grain and original UV-mapped strand colour/normal inputs are shared with reusable exports. Existing identity, pivots, foot planting and bag sockets remain.

This is visible refinement, not acceptance of the final approved target. The concept still has richer organic hair, face, cloth and scene material/light detail. Independent acceptance remains with the parent/owner.

Approved direction

v4 before

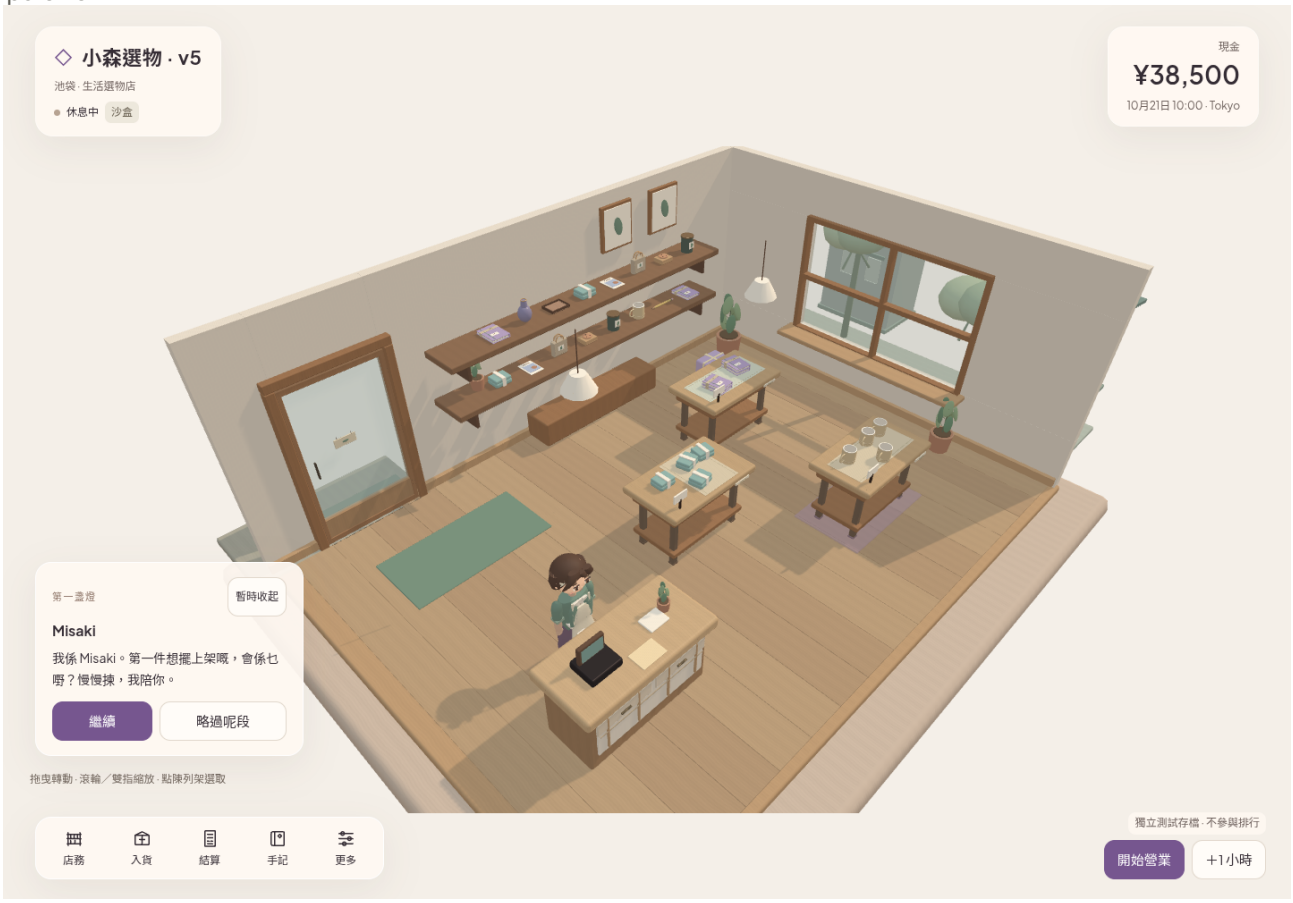

v5 candidate

Detail crops only; before/after use the same Web review camera and light. Full source PNGs and paired Web/GLB screenshots are retained.

Same-camera playable shop

High, 1440 × 1000. Identical real Sandbox stock and existing full-shop camera; no zoom or exposure manipulation.

Before: current main / v4

After: v5 candidate

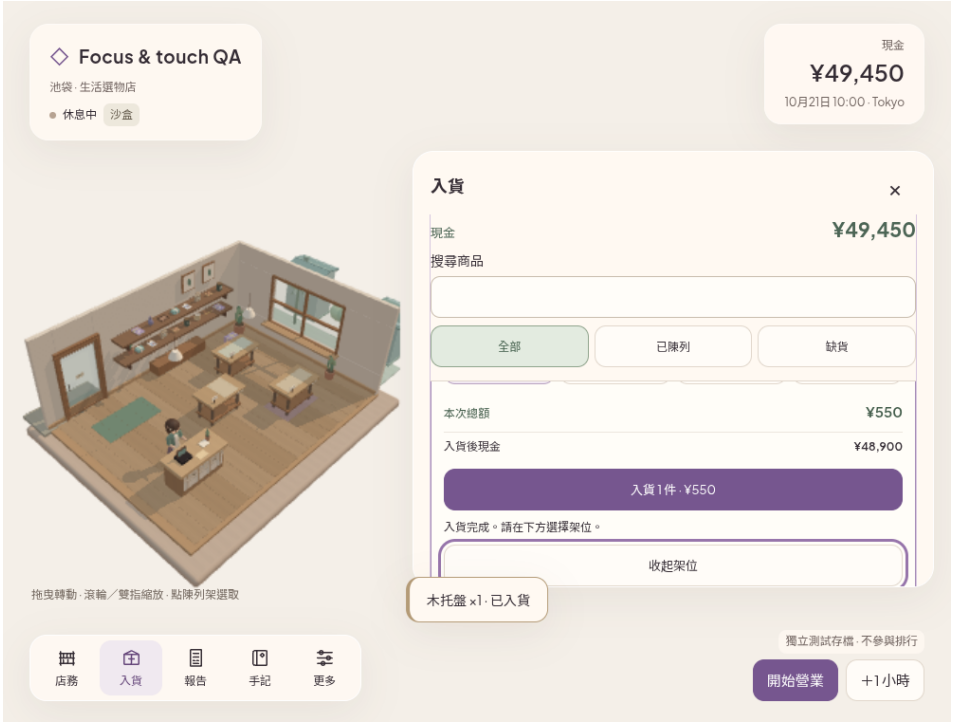

Focus, touch and persistence

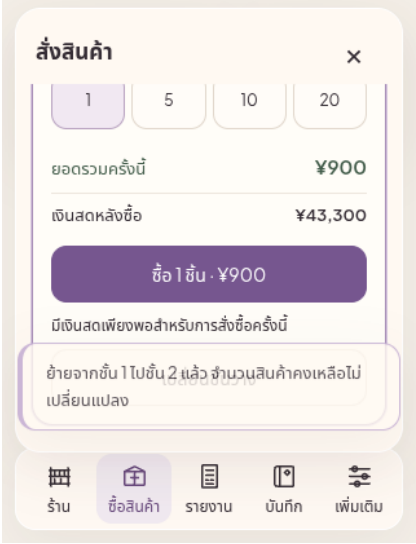

New production-browser assertions with real commands and IndexedDB. Fresh isolated Sandbox; no player Normal-save mutation.

Tab-to-buy + Enter retains focus on buy-off.tray; the next Tab reaches the same item’s placement action. A completed shelf command returns focus to the persistent card action. An actual queued writer accepts the captured 3 units once despite repeated activation and changed drafts.

Forced saves.put transaction abort leaves the entire stored snapshot and command ledger unchanged. Raw 003, input node, caret, focus and scroll survive asynchronous repaint. Reload and Chromium frozen → active preserve the Sandbox. Normal remains byte-equivalent.

Ten 320/375 × 420 touch-emulated purchase-and-place cases pass across zh-HK/en/ja/th/zh-CN; another ten 320/375 × 812 locale cases, landscape keyboard, search/filter, replacement/movement and export/import/reload pass. Controls remain at least 44px and inputs 16px.

Real A/B service and exit

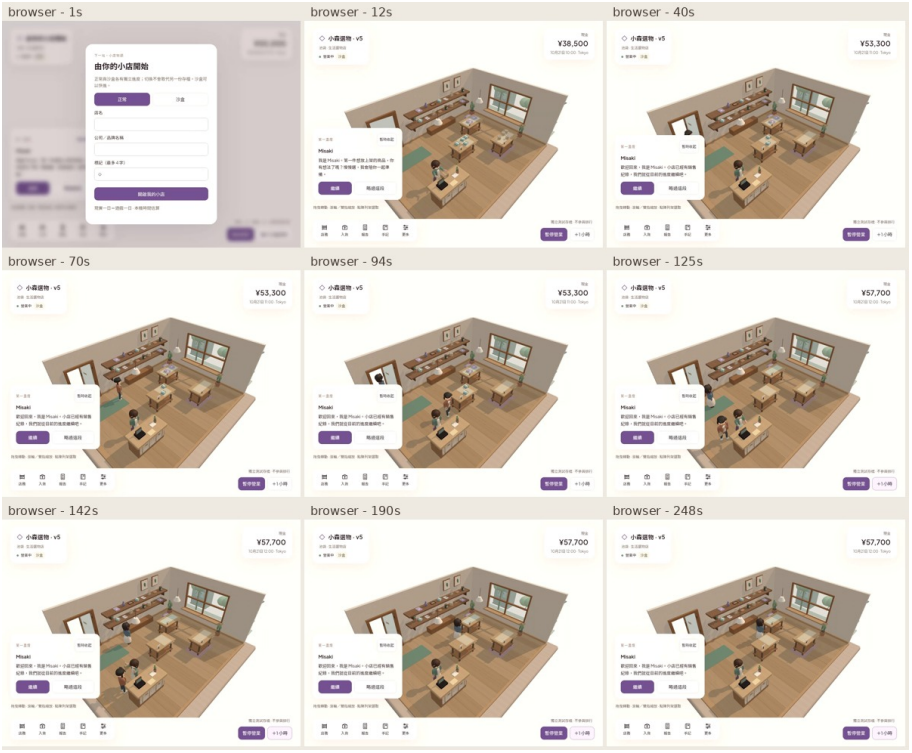

Final material-pass production build, existing visitors and actual sale settlement; no artificial customer spawn, route edit or income callback.

Visitor A: bag owner transfer at 141.198s; exit at 246.039s. High Visitor B: existing reachable approach at 126.086s, real settlement at 127.803s, bag owner transfer at 193.028s and exit at 316.513s. B has one active bag parented to actor.visitor-b.native.v3.socket-left.

Uncut recordings cover complete visits, the fallback when no visitor is eligible, UI actions, Low/Minimal FX and Reduce Motion. Chronological frames were inspected; this is not physical-device continuous playback or frame-rate acceptance.

Verification and delivery limits

New results, separated from historical v4 acceptance and future native/device work.

144 tests passed; no failed or skipped tests. Existing 2mm foot support and geometry/clearance checks remain intact. Production TypeScript/Vite build passes with the existing large-world-chunk warning.

Content validation: 10 offerings, five locales, 174 base keys each, zero errors. Replay unchanged: cash 5020, stock 4, net 180, sold units 6.

All 18 current GLBs validate with zero errors/warnings. Character exports total 1,773,228 bytes; each actor remains below 12,000 triangles. All 207 tracked asset/public files match an isolated generator rebuild byte-for-byte.

Fresh npm ci and build in an isolated checkout pass; all 119 runtime files match the browser-tested build byte-for-byte. Original eleven commits remain ancestors; 230 protected files match the starting candidate. Catalog, layout, economic rules, story logic, transactional storage, save namespaces/schema, hosting identity, fonts and older masters are retained.

Four uncut videos and paired before/after PNGs are in evidence/native-v5. Final source/history, runtime and deployment archives have CRC/SHA/source-coverage receipts supplied with the GitHub handoff.

Limits: Chromium WebGL2 / ANGLE SwiftShader is software rendering. Physical iOS/Android GPU/FPS, Safari, virtual keyboard and safe-area behavior, audio and native Unity/C#/URP are unverified. True hidden-tab visibility transition is unverified; frozen-to-active was checked. The rigid hierarchy has no embedded skeletal clips; simulation remains PORT_REQUIRED_FOR_UNITY.

Publication: user authorized checked updates at the same existing public Site. This executor has Sites tools but leaves coordinated integration/publication to the parent. No merge, Site save/deploy/access change, player Normal mutation or local Unity operation was performed. Do not present this GitHub candidate as already live.

Art acceptance: visible continuity and material/light changes are supported by actual pixels. The approved concept remains a higher visual-quality target. Do not infer final fidelity from tests or hidden geometry.
